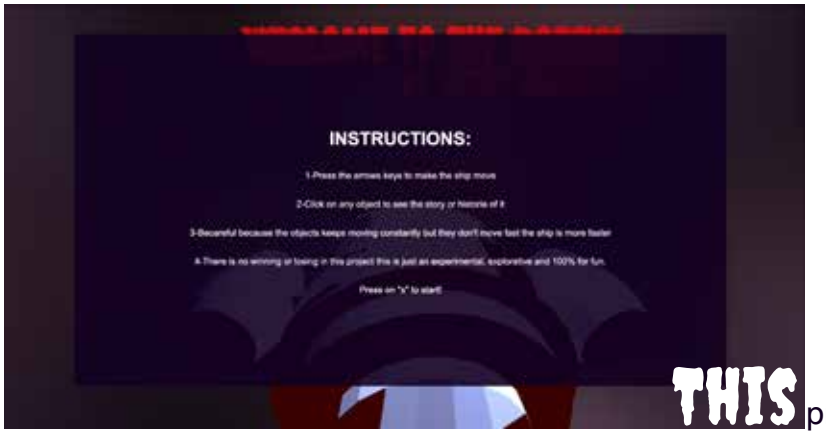
PROJECT2



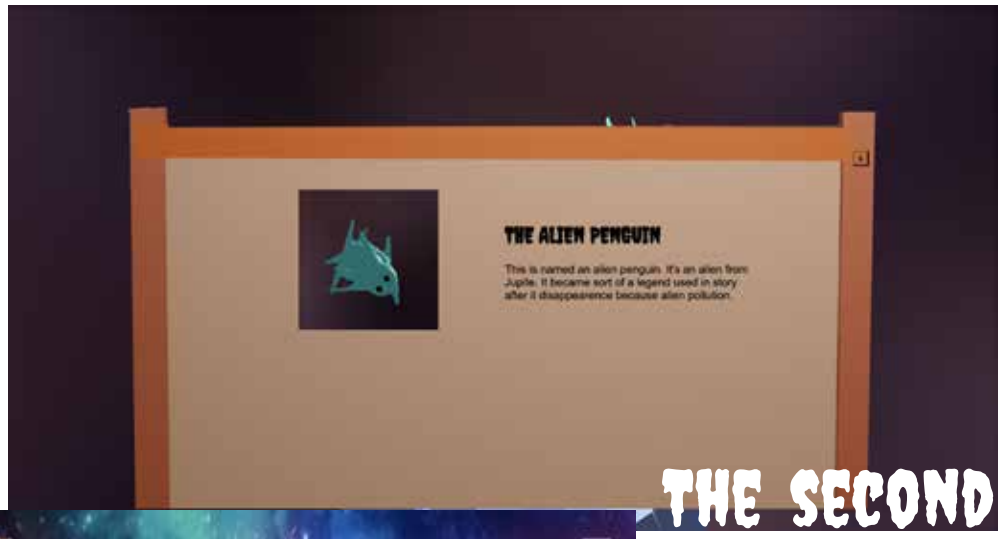
THIS project is just an experimental and adventurous exploration with no specific goal. It's purely for fun, you can't win or lose. You navigate a ship through an endless 3d environment filled with unusual and mysterious objects or creatures, a little bit as if it were a 3D portal museum. You move around using the arrow keys. You can also click on any object to open a panel where it reveals text about the history or the story of the object or creature. The main goal of this project for me was to learn and experiment with three.js, as well as to explore how to integrate standard JavaScript with three.js.

I primarily used Three.js,with some vanilla JavaScript for displaying text. The 3D objects, creatures, and ship were created in Blender and imported using GLTFLoader. To improve the atmosphere, I added background images and used blurriness to create a mysterious place feeling. I added fog to the scene where the farther you are, the objects appear darker, and when you are approaching the object, the clearer the object is. I used light for the objects to appear more three-dimensional.

FOR INTERACTIVITY, I used Raycaster to detect when users hover over a model and to make it bigger and transparent white. When you click on the models, a panel with the story of the object or creature will appear, with a small canvas where you can see the object and move it around to look at. Finally, I used animation to make models constantly move so that it feel more lively than static. Other techniques used in this project are using HTML and CSS for the panel, which is displayed when a model is clicked. I also used layers to make the model appear on the mini canvas when clicked on.

I was inspired by a cartoon I watched when I was a kid. Although my Blender skills are still beginner, I wanted to use my own 3D models in the project. I decided to create simple, odd, and weird objects to make a mysterious world museum from basic shapes and beginner Blender techniques. The idea came from Gravity Falls, a cartoon I watched when I was little, about two twins who lived with their uncle. Their uncle had a place called Mystery Shack, which is something like a museum. Most of the objects in there were basically just built by connecting objects and creatures together.

Then, in the middle of building the project, I already had the ship done before, so I had to use it somewhere. So after I used the ship and other models more and more, it resembled as an endless, mysterious 3d place rather than a museum.



THE SECOND inspiration was from a website called Big Studio, a project recognized by Awwwards. When I looked at it, I was immediately attracted to its design and interactivity. The world was created, and the bunny was moving with the arrow keys to explore the world. I loved everything about it. At first, I wanted to create something similar to " Welcome to my world but it would have taken so much more time and Blender skills.

SO, I began thinking about how I could build a unique world that I could finish before the deadline. That's when I came up with the idea of a world filled with weird objects. Since my Blender skills were still beginner level, I remembered the Mystery Shack from Gravity Falls and decided to focus on creating weird, simple object in a 3d endless, mysterious world inspired by the Big Studio.
